

Zomato Restaurant Data Analysis

Cuisine Popularity, City-wise Pricing & Rating-Cost Trends | By Kishan Yadav

Project Objective

This project analyzes Zomato's Bangalore restaurant dataset to understand three core business questions: which cuisines are most commonly offered, how average pricing varies across city locations, and whether a relationship exists between a restaurant's cost and its customer rating. A second, deeper layer of analysis looks at how restaurant type, online ordering, and table-booking availability relate to cost and rating.

Dataset Overview

Source	Kaggle - Zomato Bangalore Restaurants dataset
Original size	51,717 rows x 17 columns
Key columns used	name, online_order, book_table, rate, votes, location, rest_type, cuisines, approx_cost(for two people), listed_in(type), listed_in(city)
Final unique cuisines	105 (after cleaning combo-strings)

Tools & Workflow

Python (Pandas) was used for data cleaning — removing duplicates, fixing the rate and cost columns, converting Yes/No fields to binary, handling missing values, and splitting the multi-value cuisines column into individual rows. **Power BI** was used for data modeling, DAX measures, and building an interactive two-page dashboard.

Data Cleaning Steps (Python)

- Removed non-essential columns: url, address, phone, menu_item, reviews_list, dish_liked
- Removed duplicate rows
- Cleaned 'rate' column (e.g. "4.1/5" to 4.1) and handled 'NEW' / '-' values
- Cleaned 'approx_cost(for two people)' by removing commas and converting to numeric
- Converted online_order and book_table from Yes/No to 1/0
- Dropped rows missing rate, cost, cuisines, or location
- Standardized location and city text formatting
- Split the cuisines column by comma into individual rows, then trimmed extra whitespace

Key Insights

- **Cuisine popularity:** North Indian and Chinese are the most widely offered cuisines across Bangalore, followed by South Indian and Fast Food.
- **City-wise pricing:** Church Street, Brigade Road, and Lavelle Road have the highest average cost for two, reflecting their premium dining zones, while outer areas are comparatively affordable.
- **Rating vs cost:** Ratings are densely clustered between 3.5 and 4.5 regardless of price, showing only a weak positive relationship — a higher price does not strongly guarantee a higher rating.

- **Restaurant type:** Fine Dining and Microbrewery formats tend to have higher average ratings than Quick Bites.
- **Table booking:** Restaurants that allow table booking have a noticeably higher average cost for two, consistent with a more premium dining experience.

Cuisine popularity, city-wise average cost, and rating vs cost overview.

Dashboard - Page 2: Deeper Restaurant Trends

Restaurant type performance, online order and table booking impact, and listed-type comparison.

Conclusion

The analysis shows that cuisine choice and location drive most of the pricing variation in Bangalore's restaurant market, while price alone is a weak predictor of customer rating. Premium indicators such as table booking availability and certain restaurant formats (Fine Dining, Microbrewery) are more strongly associated with both higher cost and higher ratings.
